INSIGHTS

(a) Insight: The £21–40 bin contains the highest number of products (~7,000+), making it Zara's dominant price segment. Products thin out above £80, indicating Zara's positioning as affordable fast-fashion.

(b) Insight: There is a clear inverse relationship. As prices increase, sales volumes proportionally decrease. Lower-priced items achieve significantly higher transaction counts, indicating high price sensitivity among Zara customers.

(c) Insight: The £21 – £40 range is the "Ideal" sweet spot. It successfully balances high sales volume with significant total revenue. While cheaper items sell more units, this mid-range bracket generates the maximum financial impact for the brand.

(d) Insight: The average price does not differ significantly between sections. Both the MAN (£42.13) and WOMAN (£41.86) sections maintain nearly identical average price points, suggesting a unified pricing architecture across the brand.

(e) Insight: Discounted products show a clear reduction in average price (approximately 15% lower than non-promotional items). This confirms that promotions are being applied effectively to lower the entry barrier for customers.

INSIGHTS

(f) Insight: Promoted (discounted) products show higher average sales volumes than non-promoted products, confirming that promotions effectively drive higher unit movement. This validates the promotional strategy.

(g) Insight: The difference in sales volume between discounted and non-discounted products is most dramatic in the £0 – £20 price range. This suggests that customers at the entry-level price point are the most responsive to promotional triggers.

(h) Insight: Seasonal products see a larger absolute gain in average sales volume when promoted, compared to non-seasonal products. This suggests that combining seasonality with promotion creates a stronger uplift effect.

(i) Insight: Promoted products represent only 41.67% of the product catalog yet generate 440.71M in revenue — nearly equal to non-promoted products (443.89M) which account for 58.33% of products. This confirms that promoted products are significantly more efficient per product in driving revenue.

(j) Insight: End-cap and Front of Store positions show a higher proportion of promoted products compared to Aisle positions. This aligns with retail strategy — high-visibility locations amplify promotional impact.
